

426 WHAT IS CLAIMED IS:

1. A method for distributing timing information amongst a plurality of master
428 devices, the method comprising:

distributing a global clock to a first master device from the plurality of
430 master devices wherein said first master device operates according to a
local clock that is independent of said global clock;

432 determining an offset between said global clock and said local clock;
and

434 distributing said offset to at least one master device other than said
first master device.

436 2. The method of claim 1 wherein said global clock comprises a local clock of
one of the plurality of master devices.

438 3. The method of claim 1 wherein said offset is distributed over a
communication pathway linking said first one of said master devices to said at
440 least one of said master devices.

4. The method of claim 3 wherein said communication pathway comprises a
442 wired communication pathway.

5. The method of claim 3 wherein said communication pathway comprises a
444 wireless communication pathway.

6. The method of claim 1 wherein said distributing said offset comprises
446 storing said offset in a memory accessible to said plurality of master devices.

7. The method of claim 1 wherein said distributing said offset comprises
448 providing said offset upon receiving a request from one of said plurality of master
devices.

450 8. The method according to claim 1 wherein each of said plurality of master
devices stores said offset.

452 9. The method of claim 1 wherein said master device comprises a
Bluetooth™ device configured to act as a master.

454 10. A method for distributing timing information amongst of a plurality of master
devices, the method comprising:

456 distributing a global clock to a first master device from the plurality of
master devices;

458 generating a local clock using an offset and said global clock,
wherein said local clock is used by said first master device; and
460 distributing said offset to a second master device selected from the
plurality of master devices.

462 11. The method of claim 10 wherein each of said master devices includes a
local oscillator and wherein said global clock comprises a clock signal generated
464 by the local oscillator associated with one of the plurality of master devices.

466 12. The method of claim 10 wherein said offset is stored in a central location
and provided to at least one of said master devices.

468 13. The method of claim 10 wherein said offset is stored locally at said second
master device.

470 14. The method of claim 10 wherein said master device comprises a
Bluetooth™ device configured to act as a master.

472 15. A system comprising:

a communication pathway;

a global clock, coupled to said communication pathway; and

474 a plurality of master devices coupled to said communication
pathway, wherein each of said master devices includes:

476 a local clock generator that generates a local clock,

and

478 means for determining an offset between said global
clock and said local clock, wherein said offset is distributed to
480 at least one of said master devices.

482 16. The system of claim 15 wherein said communication pathway comprises a
wired communication pathway.

484 17. The system of claim 15 wherein said communication pathway comprises a
wireless communication pathway.

486 18. The system of claim 15 wherein said global clock comprises one of said
local clocks.

488 19. The system of claim 15 further comprising a memory coupled to said
communication pathway, wherein said offsets are stored in said memory.

490 20. The system of claim 15 wherein said offset is distributed upon request by
one of said master devices.

21. The system of claim 15 wherein each of said master devices further
includes a local memory for storing offsets associated with at least one of said
master devices.

22. The method of claim 15 wherein said master device comprises a
Bluetooth™ device configured to act as a master.

23. A system comprising:
a communication pathway;
a global clock coupled to said communication pathway;
a plurality of master devices coupled to said communication
pathway, wherein each of said master devices includes
means for generating a local clock using an offset and said global
clock, wherein said offset is available to other of said master devices via
said communication pathway.

24. The system of claim 23 wherein said communication pathway comprises a
wired communication pathway.

25. The system of claim 23 wherein said communication pathway comprises a
wireless communication pathway.

26. The system of claim 23 further comprising a memory coupled to said
communication pathway, wherein said offsets are stored in said memory.

27. The system of claim 23 further comprising a memory coupled to said
communication pathway, wherein said offsets are stored in said memory.

28. The system of claim 23 wherein said offset is distributed upon request by
one of said master devices.

29. The system of claim 23 wherein each of said master devices further
includes a local memory for storing offsets associated with at least one of said
master devices.

30. The method of claim 23 wherein said master device comprises a
Bluetooth™ device configured to act as a master.
